

Criteria 2.3.2. – Use of clinical skills laboratory and simulation based training

ENDOTRACHEAL INTUBATION

Point covered:-

Introduction

Indications/primary purpose of intubation

Types of intubation

Pre requisites for intubation

Procedure

Side effects

Recovery phase following intubation

Introduction:-

Intubation is standard procedure that involves passing a tube into a person's airway.

This is a common procedure carried out in operating rooms and emergency rooms around the world.

Indications:-

1. Maintain airway in preserve of obstruction or laryngeal spasm.
2. To prefect the airway against aspiration of stomach contents or blood and debris from operations on the head and upper airways.
3. For security in head and neck surgery, when the patient is prone or during transfer of an obtunded patient.
4. To allow IPPV – if muscle relaxation is needed (eg- abdominal SX) in thoracic operation, when suctioning can also be easily carried out to minimize dose of volatile agent and allow large doses of narcotics, in infant, where respiration is easily depressed and intubation the anatomic dead space, in respiratory failure.

Registrar
Malwanchal University
Indore (M.P.)

Types of intubation:-

1) ENDOTRACHEAL INTUBATION:-

Tube is passed through nose (nasal) or mouth (Oral) into the trachea.

2) FIBER OPTIC INTUBATION:-

Tube is passed into trachea in patients with difficult airway (flexible fiberoptic laryngoscope)

PRE - REQUISITES:-

Drugs:- Pre medication

- Inj. GPL (glycopyrrolate)

Inj. Ondansetron

Inj. Midazolam

Inj. Fentanyl

If GA has to be given (intubated under anaesthesia)

Inj propofol

Inj Sch. (succinylcholine)

Instruments - laryngoscopes - Miller

MCintosh - Macintosh

Assisted devices

- Bougie

Stylet

Light wand

Magills

Endotracheal tubes

Lignocaine jelly

Sticks

Airway - Guedels

Laryngoscope:-

Technique for direct laryngoscope and oral intubation:-

Registrar
Malwanchal University
Indore (M.P.)

- Usually undertaken in apnoea, with intermittent face mask inflation to avoid hypoxaemia and maintain inhalation at anaesthesia.
- Loose, filled or capped teeth, especially upper incisors, may be protected by guard.

5 Important components:-

a) Optimal head and neck positioning-

Achieved by – flexion of neck

Extension at atlanto- occipital joint – small pillow under the occiput.

(Obese-more pillows required)

b) Optimal muscle relaxation –

- Allows greatest response of larynx and prevents glottic closure.
- Muscle relaxants are commonly used.
- Effect is monitored by nerve stimulation.
- Reflexes may also be abolished by deep inhalation or intravenous agents, perhaps aided by topical analgesia.

c) Optimal Laryngoscope blade –

- Curved laryngoscope blade is easier to use if patients has a full set of teeth and may cause less stretching of faucial pillars than a straight blade.
- Inserted from right side of patient mouth to prevent tongue blocking the view of larynx, while watching the blade tip as it advanced alongside the tongue towards midline. When the epiglottis is seen the tip is inserted firmly but not forcibly into the vallecula used to lift the base of epiglottis forwards to reveal the cords if view is poor it is possible to change to a longer, straight or hinged blade.

d) Optimal external laryngeal manipulation:-

- Backwards and lateral pressure on the larynx by anesthetist or assistant may help bring the cords into view, it reduces the prevalence of grade 3 view from 8% to 1.5%. The best manoeuvre in BURP (Backwards, Upwards, right Pressure).

e) Optimal use of bougie:-

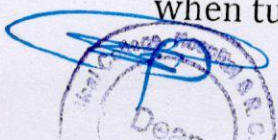

- Gum elastic bougie (correctly termed as introducer) with conde't is single most useful aid for difficult direct laryngoscopy.
- It is introduced into the trachea, sometimes blindly and used as a guide to railroad a tracheal tube.

- Indications for correct placement – (I) feeling of tracheal rings
- (II) hold upto advancement at 25 cm are the bougie encounter the carina, and a cough as the carina is stimulated.
- The laryngoscope should remain in place as the tube is railroaded and it is often necessary to withdraw the tube slightly and rotate is anticlockwise 90 degree to avoid the tip of the tube impinging on the right vocal cord.
- A hollow bougie allows capnography to confirm position before attempting intubation.
- Suitable numbered (sized) CTT (cuffed) is advanced and then fixed – cuff inflated and B/L AE is checked.

Techniques for Nasotracheal intubation-

- Required when oral tube will interface with surgery and may be indicated when oral intubation is difficult.
 - Accomplished under vision by oral direct laryngoscopy to guide the tube into larynx, perhaps using Magill's forceps, fiberoptic or by blind technique.
 - Distance B/W nares and carina in adult – 32cm (avg) – os
21cm (avg) – o+
- A. Nares should be examined for patency by listening to patient to breathing with each naris occluded. Nasal polyps should be excluded. Nasal mucosa may be shrunk by 5% cocaine, Moffett's solution or other vasoconstrictors.
 - B. Select largest to size of tube that should pass atraumatically through the large naris (os – 7mm/ o+ – 5-5mm). Position of patient head depends on the curve of the tube. Greater the curve the more flexed the head on a single pillow within slight extension of atlanto occiput joint.
 - C. Anesthetist may attempt nasal intubation with the patient apnoeic after muscle relaxation or deep inhalational anaesthesia. Lubricated tube with its concavity directed to patient feet is inserted into the naris initially upwards for 2-3cm to clear the inferior turbinate then directly backwards. Movements of bevel by rotation of tube may assist easier passage, both at this stage are when tube enters nasopharynx.

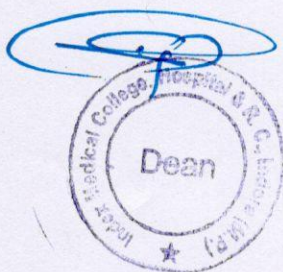

If patient is breathing spontaneously, the opposite nostril may be occluded so that all breathing is taking place through the tube. Jaw should be slightly elevated to lift the epiglottis from the posterior pharyngeal wall. If the right naris is used the head should be inclined slightly to the right, and vice versa. The anaesthesia should listen carefully to the respiration. The breath sounds conducted through the tube become maximal when its is immediately above the glottis, if the tube does not enter the larynx, its direction may be adjusted by rotation of the tube, rotation of neck or digital movement of larynx to meet the advancing tube.

- Confirmation of correct position of a tracheal tube:-
 - i. Under vision intubation
 - ii. Capnography
 - iii. Oesophageal detector device
 - iv. Chest movement and auscultation for air entry over lung fields and absence of gurgle over epigastrium (B\L equal)
 - v. Refilling of bag in expiration and misting of tube
 - vi. Palpating the tube in the larynx through the mouth oral front of neck
 - vii. The use of a lighted stylet down the tube whose light shines through the front of neck

Complications :-

- Direct trauma
- Hoarseness/ dysphagia/ sore throat
- Bleeding / epistaxis/ hematoma
- Nerve injuries – RLN (vc palsy)

Registrar
Malwanchal University
Indore (M.P.)

Fracture/ subluxation of CX spine

- Infections
- Tracheal rupture during anaesthesia
- Ignition of the tube during laser surgery
- Obstruction of tube
- Acute glottic oedema
- Laryngeal ulceration and granuloma formation
- CVS responses - HRT, BPT, intraocular pressure increases, ict increases.

C/I

- Cervical spine injury (relative) - stabilization important
- # Anterior cranial fossa
- Retropharyngeal swelling
- Fractured larynx.-

A large, stylized handwritten signature in black ink.

Programme Report

Basic Life Support (BLS) training programme

It is essential for every doctor to have a knowledge and skill of performing Basic Life Support (BLS) procedure, which can be required in any emergency condition.

A training programme on Basic Life Support was organized in Index Medical College Hospital, Indore for interns, post graduate students and paramedical staff in July 2022.

Training was provided by Dr. Nikita Dhomne, Asst. professor of Anaesthesia department, along with the assistance of some PG students from her department. Trainees (Interns, PG students and paramedical staff) were divided in various batches. Training was given in three repetitive sessions on 1st, 7th and 20th July 2022.

First, there was a brief presentation by the trainer on Basic life support, which was mainly focused on the need of BLS, proper procedure and common mistakes during BLS etc. This was followed by a demonstration of the procedure on BLS manikin by PG residents of Anaesthesia department. Major emphasis was given on proper head position, chest compression, bag & mask ventilation etc. In order to make every step clearly visible to all trainees, the process was also projected simultaneously on screen through a recording camera.

Overall, this learning programme was a great experience and opportunity for all resident doctors of clinical specialities.

Programme Report

Basic Life Support (BLS) training programme

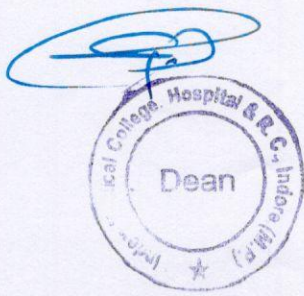

It is essential for every doctor to have a knowledge and skill of performing Basic Life Support (BLS) procedure, which can be required in any emergency condition.

A training programme on Basic Life Support was organized in Index Medical College Hospital, Indore for interns, post graduate students and paramedical staff in July 2022.

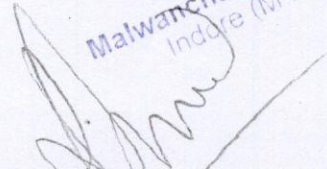

Training was provided by Dr. Nikita Dhomne, Asst. professor of Anaesthesia department, along with the assistance of some PG students from her department. Trainees (Interns, PG students and paramedical staff) were divided in various batches. Training was given in three repetitive sessions on 1st, 7th and 20th July 2022.

First, there was a brief presentation by the trainer on Basic life support, which was mainly focused on the need of BLS, proper procedure and common mistakes during BLS etc. This was followed by a demonstration of the procedure on BLS manikin by PG residents of Anaesthesia department. Major emphasis was given on proper head position, chest compression, bag & mask ventilation etc. In order to make every step clearly visible to all trainees, the process was also projected simultaneously on screen through a recording camera.

Overall, this learning programme was a great experience and opportunity for all resident doctors of clinical specialities.

Endotracheal intubation training programme

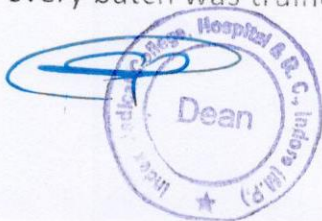

Endotracheal intubation is an emergency life saving procedure, which is required to maintain airway of patient in emergency conditions like cardiac arrest, head injury etc. Besides, it is a routine procedure required to give general anaesthesia to the patient for any routine or emergency surgery. Also, it is commonly done in I.C.U. to keep patients on mechanical ventilation due to various indications.

Because of these specific indications, usually the faculties and postgraduate students of Anaesthesia and Medicine department have a greater skill and experience of this procedures, while faculties and residents of other departments are mostly not well versed and confident in performing endotracheal intubation of any patient.

But, it is essential for every doctor to have a basic knowledge of this procedure, as it may be required during any emergency condition. For example, a resident doctor of Surgery, ENT or Orthopaedics department may have to intubate a patient of polytrauma in casualty. Besides, all doctors of surgical specialities (Surgery, Orthopaedics, Obstetrics & Gynaecology, ENT, Ophthalmology) should be aware of all steps of intubation, even if it is being performed routinely by an Anaesthetists in operation theatre.

So, keeping all these goals in mind, a training programme on endotracheal intubation was organized in Skills Lab of Index Medical College Hospital, Indore for post graduate students of all clinical specialities from 17/12/2021 to 13/01/2022.

Training was provided by faculties of Anaesthesia department, who were assisted by a postgraduation student of their department. Manikin of endotracheal intubation was used for this training in the Skills Lab. PG students of all clinical departments were divided in batches of 13 to 15 students, and every batch was trained on the scheduled day at 2 pm.

Regular
Malwanchal University
Indore (M.P.)

Initially, a brief introduction was given by the trainer about the basic knowledge like common indications of endotracheal intubation, various requirements etc. Then he/she performed a demonstration of procedure on the intubation manikin. After that, every trainee was given an opportunity to perform the procedure. All types of difficulties and mistakes were explained by demonstration during this procedure. This was followed by a brief discussion time during which, participants had asked various types of questions to the trainer.

This course was enthusiastically attended by PGs of 2019 and 2020 admission batch. They not only learnt the steps of this procedure, but also understood the importance of required skills and difficulties in this basic procedure. Each PG had been given a personal attention by the trainer and the assistant. Everyone had got the opportunity to intubate the manikin, and he/she was allowed to try upon it till the success.

Overall, this learning programme was a great experience and opportunity for all resident doctors of clinical specialities.

Capacity Building Course

It is essential for a doctor to acquire the skills of all three learning domains – cognitive, psychomotor and affective. In our teaching curriculum, during under graduation period, majority of focus is made on cognitive learning domain only, while the other two are mostly learnt only after entering in internship phase.

Keeping the above thought in mind, Malwanchal university had organized a skill training course in Skills Lab of Index Medical College for M.B.B.S. final year students of 2016 admission batch from 4th to 26th December 2020.

This course was intended to make an early exposure of training of psychomotor domain in form of various commonly required skills like basic life support, intravenous line insertion, dressing, suturing, catheterization etc. Total 25 students had enthusiastically attended all sessions of this training course.

The course was conducted after routine college hours. Training was conducted in the Skills Lab of Index Medical College, using the manikins of various procedures. Training was provided by the expert faculties from departments of Medicine, Surgery, Pediatrics and Anesthesia departments.

Every training session started with the briefing of procedure by the trainer. It was followed by the demonstration of the procedure on manikin. After this, each participant had received an opportunity to perform the procedure of his/her own.

Whole programme was enthusiastically attended by all participants.
